Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

EMBO J. 15, 4909-4918, 1996
A;Title: Association of inhibitory tyrosine protein kinase p50(csk) with protein tyrosine A; Ancesion: G1052; MUID:97045099; PMID:8890164

A)Gene: 70zpep C;Complex: physically associates with inhibitory tyrosine protein kinase Csk; interaction C;Punction: C;Punction: probably an effector and/or regulator of tyrosine protein kinase csk in T-C;Superfamily: protein-tyrosine-phosphatase, nonreceptor type 8; protein-tyrosine-phosphi C;Keywords: phosphoprotein; phosphoric monoester hydrolase; tyrosine-specific phosphatase F;54-278/Domain: protein-tyrosine-phosphatase homology <PTP> F;497-802/Region: glutamic acid/proline/serine/threonine-rich F;688-659/Region: proline-rich F;688-659/Region: proline-rich F;227/Active site: Cys (phosphocysteine intermediate) #status predicted F;237/Binding site: substrate phosphate (Arg) #status predicted AjAccession: S71952
AjStatus: mucleic acid sequence not shown; not compared with conceptual translation
AjMolecule type: mRNA
AjRolecules: 495-789 <CLO>
CjComment: This protein is found primarily in hematopoietic tissues.
CjGenetics:
AjGene: 702pep
CjComplex: physically associates with inhibitory tyrosine protein kinase Csk; interaction CjFunction:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mol. Cell. Biol. 12:2396-2405(1992).
-!- CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)0 = protein tyrosine + phosphate + H(2)0 = protein tyrosine + phosphate.
-!- SUBCELIULAR LOCATION: Cytoplasmic.
-!- TISSUE SPECIFICITY: Spleen, thymus, lympH node and bone marrow.
-!- SIMILARITY: Belongs to the protein-tyrosine phosphatase family.
Non-receptor class subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matthews R.J., Bowne D.B., Flores E., Thomas M.L.;

-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to the protein-tyrosine phosphatase family.
Non-receptor class subfamily.
                                                                                                                                                                                                                                                                                 REVISIONS TO 297-416.

FUNCTION: May play a role in the maintenance of pluripotency. Down-regulated during differentiation. CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)0 = protein
                                                                         tyrosine + phosphate.
--- SUBCELLULAR LOCATION: Type I membrane protein.
--- DEVELOPMENTAL STAGE: Detectable in the epiblast of oocytes and throughout early mouse embryo development. In adult, expression localized in gonadal germ calls.
--- SIMILARITY: Contains 2 protein-tyrosine phosphatase domains.
--- SIMILARITY: Contains 10 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (POTENTIAL)

-!- FUNCTION: Plays a key role in hematopoiesis. This PTPase activity may directly link growth factor receptors and other signaling proteins through protein-tyrosine phosphorylation. The SHZ regions may interact with other cellular components to modulate its own phosphatase activity against interacting substrates (By

--- SUBINIT: Monomer (By similarity). Binds PTPNS1 (By similarity).
--- SUBCELLUIAR LOCATION: Cytoplasmic (By similarity).
--- SIMILARITY: Belongs to the protein-tyrosine phosphatase family.
Non-receptor class subfamily.
--- SIMILARITY: Contains 2 SH2 domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             "The rat SH2-containing protein-tyrosine phosphatase SHP-1 is a positive regulator of NGF-induced neuronal differentiation of PC12 cells.";

With protein tyrosine phosphatase SHP-1 in macrophages.";

J. Biol. Chem. 273:22719-22728(1998).

I. FUNCTION: Plays a key role in hematopoiesis. This PTPase activity at directly link growth factor receptors and other signaling proteins through protein-tyrosine phosphorylation. The SH2 regions may directly link growth factor receptors and other signaling proteins through protein-tyrosine phosphorylation. The SH2 regions may interact with other cellular components to modulate its own phosphatase activity against interacting substrates.

C. -- CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)O = protein tyrosine + phosphate.

C. -- SUBGELIULAR LOCATION: Cytoplasmic.

"Identification of a hormonally regulated protein tyrosine
phosphatase associated with bone and testicular differentiation.";
J. Biol. Chem. 269:30659-30667(1994).
-!- FUNCTION: May function in signaling pathways during bone
remodeling, as well as serve a broader role in cell inceractions
associated with differentiation in bone and testis. Optimal pH for
phosphatase activity is 5.6. Associated with differentiation in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         128 LMACREIENGRKRCERYWAQEQEPLQTGLFCITLIKEKWLNEDIMLRTLKVTFQKES---

Note=No experimental confirmation available;
Note=No experimental confirmation available;
TISSUE SPECIFICITY: Bone and testis. In the latter, restricted to
the basal portion of the seminiferous tubule.
BEVELOPMENTAL STAGE: Up-regulated in differentiating cultures of
primary osteoblasts and down-regulated in late stage mineralizing
cultures. In testis, expression is highest between stages; and
vII when maturing spermatids remain buried within the sertoli
bone and testis.
-!- CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)0 = protein tyrosine + phosphate.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- ALTERNATIVE PRODUCTS:
                                                                                                                                     Event=Alternative splicing, Named isoforms=2;
Comment=A presumed alternate transcript of 4.8-5.0 kilobases,
which may lack PTP domains, is present in proliferating
osteoblasts, but not detectable at other stages;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         epithelium.
-!- INDUCTION: By parathyroid hormone and CAMP analogs.
-!- PTM: The cytoplasmic domain contains potential phosphorylation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sites.
-!- SIMILARITY: Contains 2 protein-tyrosine phosphatase domains.
-!- SIMILARITY: Contains 10 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CYTOPLASMIC (POTENTIAL).

--- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
--- TISSUB SPECIFICITY: Expressed in embryonic fibroblast,
hematopoietic, erythroid, myeloid and lymphoid cells.
--- PTW: Phosphorylated by tyrosine-protein kinases (By similarity).
--- SIMILARITY: Belongs to the protein-tyrosine phosphatase family.
Non-receptor class subfamily.
--- SIMILARITY: Contains 2 SH2 domains.

-1. FUNCTION: This PyrBase activity may directly link growth factor receptors and other signaling proteins through protein-tyrosine phosphorylation. The Stz regions may interact with other cellular components to modulate its own phosphatase activity against VARIANTS NS ALA-42; ALA-60; ASN-61; GLY-61; ASP-62; CYS-63; GLY-72;

[MIM:151100], an autosomal dominant disorder allelic with Noonan syndrome. The acronym LEOPARD stands for lentigines, electrocardiographic conduction abnormalities, ocular hypertelorism, pulmonic stenosis, abnormalities of genitalia, retardation of growth, and deafness.

-!- DISMESE: Defects in PrPN11 are a cause of Noonan syndrome [NS]
[MIM:163950]; also designated Noonan syndrome [NS]
[MIM:163950]; also designated Noonan syndrome [NS] is an autosomal dominant disorder characterized by dysmorphic facial features, short stature, hypertelorism, cardac annomalies, deafness, motor delay, and a bleeding diathesis. It is a genetically heterogeneous and relatively common syndrome, with an estimated incidence of 1 in 1000-2500 live births. Wutations in PTPN11 account for more than 50% of the cases. Rarely, NS is associated with juvenile myelomonocytic leukemia (JMML).
-!- DISMESE: Defects in PTPN11 are a cause of Noonan-like syndrome (MIM:163955); also known as Noonan-like/multiple giant cell lesion syndrome. It is an autosomal dominant disorder characterized by noonan features associates with giant cell lesions of bone and This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the Buropean Bioinformatics Institute. There are no restrictions on its work by non-profit institutions as long as its content is in no way modified and this statement is not removed. -!- SIMILARITY: Belongs to the protein-tyrosine phosphatase family.
-!- SIMILARITY: Contains 2 SH2 domains. Crystal structures of peptide complexes of the amino-terminal SH2
domain of the Syp tyrosine phosphatase.";
Structure 2:423-438(1994).
-!- FUNCTION: This PTPase activity may directly link growth factor
receptors and other signaling proteins through protein-tyrosine
phosphorylation. The SH2 regions may interact with other callular
components to modulate its own phosphatase activity against
interacting substrates.
-!- CARALYTIC ACTILITY: Protein tyrosine phosphate + H(2)O = protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ullrich A.; "A family of proteins that inhibit signalling through tyrosine kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               tyrosine + phosphate.
-! SUBMIT: Binds PTRNS1.
-!- SUBMIT: Binds PTRNS1.
-!- SUBGELULAR LOCATION: Cytoplasmic.
-!- PTM: Phosphorylated by tyrosine-protein kinases.
-!- SIMILARITY: Belongs to the protein-tyrosine phosphatase family.
Non-receptor class subfamily.
-!- SIMILARITY: Contains 2 SH2 domains.
                                                                                                                                                                                                                                                                                                             SEQUENCE FROM N.A.
